Ageton's Tables

ARTHUR AINSLIE AGETON (25. Oktober 1900 – 23. April 1971) entwickelte eine überraschend einfache Methode, Höhenstandlinien aus Gestirnsbeobachtungen zu berechnen.

Bevor es Taschenrechner gab, mussten die Gleichungen der sphärischen Geometrie mit Hilfe der Logarithmentafeln von FULST, ROSE oder NORIE's gelöst werden, was oft als sperrig und umständlich empfunden wurde.

Es gibt eine Vielzahl Methoden, bekannt unter dem Oberbegriff Sight Reduction Tables, die die Benutzung von klassischen Logarithmentafeln obsolet machen.

- HO 249
- A. P. 3270
- NAO Sight Reduction Tables
- Record Tables nach LIEUWEN

All diese Methoden haben den Nachteil, dass nicht von einem Koppelort ausgegangen wird, sondern von einem Rechenort. Um den Umfang der Tafelwerke überschaubar zu halten, werden Berechnungen nur für ganzgradige Werte einiger Eingangsgrößen zur Verfügung gestellt. Da der Koppelort ohnehin unsicher ist, kann er durchaus so verlegt werden, dass die gewünschten runden Werte realisiert werden. Eine wichtige Information geht dabei jedoch verloren. Bei Bezug auf den Koppelort kann aus der Höhendifferenz Δh eine Rückmeldung über die Qualität von Koppelort und Sextantmessung gewonnen werden.

Bei der Methode nach AGETON bleibt der Qualitätsindikator erhalten. Wie gewohnt wird vom Koppelort ausgegangen. Lediglich zwei Funktionen $A(x)$, $B(x)$ werden tabelliert.

$$A(x) = 10^5 \cdot \log_{10} \left[\frac{1}{|\sin x|} \right], \quad B(x) = 10^5 \cdot \log_{10} \left[\frac{1}{|\cos x|} \right]$$

Um den Tabellenumfang klein zu halten, sind nur die Werte $x \in [0^\circ, 180^\circ]$ aufgeführt. Die Winkel x können bis auf Zehntelminuten genau eingesetzt werden. Mit nur 90 Seiten fällt diese Tafel zudem überraschend schlank aus.

Grenzen des Verfahrens

Die Grenzen des Verfahrens werden in der Veröffentlichung *Anwendung von AGETON's Tables in der Astronomischen Navigation* [VENANW] näher beschrieben.

Quellenangaben

AGETON's Tables, zeitweise auch H.O. 211 genannt, sind nur noch antiquarisch zu erhalten, jedoch hat ERIK DE MAN sich dieses Themas angenommen, AGETON's Tables in C programmiert und auf seiner Internetpräsentation <http://www.siranah.de> verfügbar gemacht. Ebenso stellt HENNING UMLAND auf seiner Internetpräsentation <http://www.celnav.de> die Tafel bereit.

Die hier vorliegenden AGETON's Tables wurden von mir in L^AT_EX mit Hilfe der packages `spreadtab` und `numprint` neu berechnet. Obwohl mit großer Sorgfalt programmiert, kann keine Garantie auf Fehlerfreiheit gegeben werden. Die Benutzung dieser Tafel erfolgt auf eigene Gefahr.
